ABSTRACT

Background: Dental and oral health problems are most commonly experienced by children aged 6-12 years. The main problem in the oral cavity of children to date is dental caries disease. A very basic cause is a lack of self-awareness and parents in getting used to it. Children brush their teeth well and correctly and on time.

Research Objectives: Know the picture of brushing habits before going to bed at night and cases of dental caries in elementary school-age children.

Research Methods: This type of research is descriptive with data collection techniques that use a cross sectional approach, the number of respondents is 30 respondents, samples are taken with saturated sampling methods. The data collection method uses questionnaires about brushing habits before going to bed at night and the observation format of dental caries through google form online.

Research Results : The results showed that respondents had cases of dental caries with caries-free criteria as much as (30%), caries criteria a little as much as (50%), and many dental caries criteria. As much as (20%). while those who have the habit of brushing their teeth before going to bed at night with good criteria as much as (40%) and bad criteria as much as (60%).

Conclusion: Elementary school-aged children of Dusun Turen have a habit of brushing their teeth before going to bed at night criteria both with cases of dental caries-free criteria (66.7%).

Keywords: brushing habits, dental caries, elementary school children
