ABSTRAK

Latar Belakang: Durasi intubasi mengacu pada periode waktu dimana endotracheal tube ditempatkan dan dipertahankan di dalam saluran napas pasien. Proses ini melibatkan pemasangan tabung melalui mulut atau hidung ke dalam trachea untuk memberikan saluran napas pasien yang tidak adekuat. Hemodinamik yang terjadi perubahan aliran darah dan tekanan dalam sistem kardiovaskuler yang dapat disebabkan oleh tindakan laringoskopi dan intubasi endotrakeal.

Tujuan: Mengetahui hubungan durasi intubasi dengan kestabilan hemodinamik pasien bedah saraf intraoperatif di RSUD Prof. Dr. Margono Soekarjo Purwokerto.

Metode: Studi ini merupakan penelitian observasi analitik dengan pendekatan *cross sectional*. **Subjek** penelitian ini pasien bedah saraf intraoperasi durasi intubasi dengan kestabilan hemodinamik. Teknik pengambilan sampel dengan *consecutive sampling* sebanyak 80 sampel. Insturmen penelitian menggunakan lembar obsevasi dan stopwatch. Analisa data menggunakan uji *Chi square*.

Hasil: Hasil uji statistik *Chi square* nilai *P value* yang dihasilkan sebesar 0.000 <0.05, dapat **disimpulkan** bahwa terdapat hubungan yang signifikan antara durasi intubasi dengan kestabilan hemodinamik pasien bedah saraf intraoperatif di RSUD Prof. Dr. Margono Soekarjo Purwokerto.

Kesimpulan: Ada **hubungan** durasi intubasi dengan kestabilan hemodinamik pada pasien bedah saraf intraoperatif di RSUD Prof. Dr. Margono Soekarjo Purwokerto.

Kata Kunci: durasi intubasi, kestabilan hemodinamik, bedah saraf, intraoperatif

ABSTRACT

Background: intubation duration refres to the period of time that an endotracheal tube is placed and maintained in the patient's airway. This process involves the insertion of a tube through the nasal passages inti the trachea to provide an indaquate airway for the patient. Hemodinamic changes in blood flow and pressure in the cardiovascular system can be caused by laryngoscopy and endotracheal intubation.

Objective: To determine the relationship between intubation duration and hemodynamic stability of intraoperative neurosurgery patients at Prof. Dr. Margono Soekarjo Purwokerto Hospital.

Methods: This study was an analytical observational study with a crosssectional approach. The subjects of this study were intraoperative neurosurgery patients with intubation duration and hemodynamic stability. Sampling technique with consecutive sampling as many as 80 samples. Research instruments used observation sheets and stopwatches. Data analysis using the Chi Square test.

Result: Chi Square statitical test the resulting P value of $0.000 < 0.05$, it can be concluded that there is a significant relationship between the duration of intubation with hemodynamic stability of intraoperative neurosurgery patients at Prof. Dr. Margono Soekarjo Purwokerto Hospital.

Conclusion: There is a relationship between intubation duration and hemodynamic stability in intraoperative neurosurgery patients at Hospital Prof. Dr. Margono Soekarjo Purwokerto.

Keywords: Intubation duration, hemodynamic stability, neurosurgery, intraoperative
