ABSTRACT

Background: patient safety is a system that makes patient care more secure, including risk assessment, identification, and management related to patient risk, incident reporting and analysis, able to learn from incidents and implementation. Through the standard precautions of prevention and control of infections at the hospital, one of them with the management of linen in the operating room.

Objective: to know the relationship of nurse knowledge about standard precautions: linen management with linen management behavior in operating room of Dr. Soeradji Tirtonegoro Klaten.

Method: non experimental quantitative research type, because it uses the method of analytic observation and no intervention or planning on the respondent. Sampling technique with total sampling of 48 anesthesia and surgical nurses. Analysis using chi square.

Results: respondents' knowledge of standard precautions: management of linen showed poor as many as 43 samples (89.6%) and linen management behavior showed good as many as 45 samples (93.7%). The result of chi square test is 0,372 correlation coefficient and p value 0,542 ($p > 5\%$). This shows the nurse's knowledge of standard precautions: the management of this linen has nothing to do with the behavior of linen management. This is because the behavior is good because it has experience and has been accustomed to the management of linen.

Conclusion: there is no relation between nurse knowledge about standard precautions: linen management with linen management behavior in operating room of Dr. Soeradji Tirtonegoro Klaten

Keywords: knowledge, standard precautions: linen management, behavior

INTISARI

Latar belakang: keselamatan pasien adalah suatu sistem yang membuat asuhan kepada pasien lebih aman, meliputi assesmen resiko, identifikasi, dan penatalaksanaan yang berhubungan dengan resiko pasien, pelaporan dan analisis insiden, mampu belajar dari insiden serta implementasi. Melalui kewaspadaan standar yaitu pencegahan dan pengendalian infeksi di rumah sakit, salah satunya dengan penatalaksanaan linen di ruang operasi.

Tujuan: diketahuinya hubungan pengetahuan perawat tentang kewaspadaan standar: penatalaksanaan linen dengan perilaku penatalaksanaan linen di Instalasi Bedah Sentral RSUP Dr. Soeradji Tirtonegoro Klaten.

Metode: jenis penelitian kuantitatif non ekperimental, karena menggunakan metode observasi analitik dan tidak ada intervensi atau perencanaan terhadap responden. Teknik pengambilan sampel dengan total sampling sebanyak 48 perawat anestesi dan bedah. Analisis menggunakan *chi square*.

Hasil: pengetahuan responden tentang kewaspadaan standar: penatalaksanaan linen menunjukkan kurang baik sebanyak 43 sampel (89,6%) dan perilaku penatalaksanaan linen menunjukkan baik sebanyak 45 sampel (93,7%). Hasil uji *chi square* diketahui koefisien korelasi 0,372 dan *p value* 0,542 ($p > 5\%$). Hal ini menunjukkan antara pengetahuan perawat tentang kewaspadaan standar: penatalaksanaan linen ini tidak ada hubungannya dengan perilaku penatalaksanaan linen. Ini disebabkan karena perilakunya baik karena memiliki pengalaman serta sudah terbiasa melakukan penatalaksanaan linen.

Kesimpulan: tidak ada hubungan antara pengetahuan perawat tentang kewaspadaan standar: penatalaksanaan linen dengan perilaku penatalaksanaan linen di Instalasi Bedah Sentral RSUP Dr. Soeradji Tirtonegoro Klaten

Kata Kunci: pengetahuan, kewaspadaan standar: penatalaksanaan linen, perilaku
