## **ABSTRACT**

**Background:** Schizophrenia is a complex mental disorder that can cause a person to experience cognitive, perceptual, emotional, behavioral & socialization disorders with the most common symptom being delusions. According to the World Health Organization (2018), schizophrenia is a mental disorder that affects more than 20 million people in the world. In Indonesia, according to Riskesdas 2018, the DIY province is in second place at 10.4 per mile. A preliminary study conducted at Wisma Srikandi RSJ Grhasia on May 9, 2022, obtained data in the last one month period during July - May the number of confirmed patients with a diagnosis of paranoid schizophrenia as many as four people with the main nursing problem of delusions as many as two people.

**Research Objectives:** To analyze and apply psychiatric nursing care for patients with the main problem of delusional suspicion by using the SIKI and Evidence Based Practice as a reference in providing care.

**Methods:** Interview, observation, physical examination and document study with a nursing process approach.

**Results:** After nursing actions were carried out for 1 meeting in 1 shift for 5 days by applying nursing interventions for delusional management, cognitive therapy, supportive therapy, social skill training, support for treatment program compliance and assertive training, the criteria for achievement outcomes were obtained according to the SLKI with delusional results. suspicion partially resolved.

**Conclusion:** The final evaluation obtained after the implementation was carried out on Mrs. R with the main problems being partially resolved, chronic low self-esteem partially resolved, social isolation partially resolved, non-compliance partially resolved and the risk of violent behavior fully resolved.

**Keywords:** Schizophrenia, Delusions, Nursing Interventions Delusions
